

# Microresurfacing System Ideal Gateway Treatment for All Skin Types

By Jeffrey Frentzen, Executive Editor

How many times have you heard a product touted as a “gateway treatment” only to discover it’s not true? In the case of DermaSweep™ from DermaSweep, Inc. (Rocklin, Calif.), it is entirely true.

DermaSweep’s 3-in-1 microresurfacing therapy works on a range of skin concerns. This multi-use device features bristle tip exfoliation and increased circulation for a gentle, yet effective treatment, including adjustable vacuum pressure that is suitable for all skin types.

According to Kevin S. Pinski, M.D., a cosmetic dermatologist in Chicago, Ill., DermaSweep procedures are customized depending on skin type, preferred level of exfoliation and desired results. “DermaSweep has been a nice, introductory level treatment for people coming into the office for the first time.”

It is also a good choice for those looking for maintenance between more aggressive procedures, such as laser resurfacing or skin

tightening,” he continued. “DermaSweep’s mild treatment gives the skin a nice glow and improves texture, as well as softens the appearance of large pores. Though good results can be realized after one treatment, a series of sessions is often recommended for optimal outcomes.”

DermaSweep also treats a wide range of skin disorders, from acne and surgical scars to post-inflammatory hyperpigmentation (PIH), photodamage, melasma and more, Dr. Pinski noted.

“It is a safe, relatively non-invasive treatment for skin rejuvenation. The result is more radiant, supple and firmer skin, with fewer lines and wrinkles, as well as overall improved tone,” he expressed.

Additionally, DermaSweep offers multifunctional, skin specific infusions containing scientifically-proven ingredients. The infusion process uses a silk soft tip with a variety of ingredients and vitamins to bolster the skin barrier, including repairing enzymes, skin renewing peptides, skin improving growth factors, nourishing proteins and ceramides, antioxidants and skin clarifying alpha-hydroxy acids, as well as probiotics and beta-hydroxy acids.

As reported by Vivian Bucay, M.D., a medical and cosmetic dermatologist in San Antonio, Texas, “DermaSweep is good for a quick complexion refresh and glow.”

I love this combination of exfoliation, followed by an infusion of a customized solution, such as salicylic acid, which makes my skin look firmer and radiant,” she added. “Other infusions can be customized to include vitamin C, hyaluronic acid or growth factors, and chemical peels to name a few options.”

DermaSweep integrates well with a patient’s regular skincare regimen, too, Dr. Bucay shared. “There’s no downtime and the procedure takes about 20 minutes. Results are immediate, which is why this is one of my favorite treatments when I want to look ‘red carpet ready.’”

In Dr. Pinki’s experience, DermaSweep provides very high revenue opportunities for aesthetic practices.

“Every other practice has standard microdermabrasion devices. We were looking for something that would set us apart from the competition,” he said. “As a result, DermaSweep has been extremely well received by patients. It is a unique and beneficial treatment that the spa next door is not doing. Microdermabrasion is great, but DermaSweep is a step above.”
